

**CLASS-XII**  
**CHAPTER-01**  
**RELATION AND FUNCTION**  
**02 MARKS TYPE QUESTIONS**

Q. No.	QUESTION	MARK
1	<p>An equivalence relation <math>R</math> in <math>A</math> divides it into three equivalence classes <math>A_1, A_2, A_3</math>. What is the value of the following?</p> <p>(i) <math>A_1 \cup A_2 \cup A_3</math>                      (ii) <math>A_1 \cap A_2 \cap A_3</math></p>	2
2	<p>Are the following set of ordered pairs functions?.</p> <p>(i) <math>\{(x, y): x \text{ is a person, } y \text{ is the mother of } x\}</math>.</p> <p>(ii) <math>\{(a, b): a \text{ is a person, } b \text{ is an ancestor of } a\}</math></p> <p>If so, examine whether the mapping is one-one, many-one or onto.</p>	2
3	<p>Let <math>A = \{a, b, c\}</math> and the relation <math>R</math> be defined on <math>A</math> as follows:  <math>R = \{(a, a), (b, c), (a, b)\}</math>. Then, write the minimum number of ordered pairs to be added in <math>R</math> to make <math>R</math> reflexive and transitive.</p>	2
4	<p>Given <math>A = \{2, 3, 4\}</math>, <math>B = \{2, 5, 6, 7\}</math>. Define a function from <math>A</math> to <math>B</math> such that the function is:</p> <p>(a) an injective mapping from <math>A</math> to <math>B</math></p> <p>(b) a mapping from <math>A</math> to <math>B</math> which is not injective</p>	2
5	<p>Which of the following graph represents one-one function? Fig-1 or Fig-2?</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  <p><b>Fig-1</b></p> </div> <div style="text-align: center;">  <p><b>Fig-2</b></p> </div> </div> <p>Justify your answer.</p>	2
6	<p>If <math>R = \{(a, a^3): a \text{ is a prime number less than } 5\}</math> be a relation. Find the range of <math>R</math></p>	2

7	Let R is the equivalence relation in the set $A = \{0,1, 2, 3, 4, 5\}$ given by $R = \{(a, b) : 2 \text{ divides } (a - b)\}$ . Write the equivalence class .	2
8	If $R = \{(x, y): x + 2y = 8\}$ is a relation on $N$ , then write the range of R.	2
9	Show that the function $f: R \rightarrow R$ , defined as $f(x) = x^2$ , is neither one-one nor onto.	2
10	Show that the function $f: R \rightarrow \{x \in R: -1 < x < 1\}$ defined by $f(x) = x/(1+ x )$ , $x \in R$ is one one and onto function.	2
11	Let us take an example if suppose we have a set X consisting of exactly 200 elephants in a farm. Are there any chances of finding a relation of getting a rabbit in the poultry farm?  	2
12	Pablo charges \$20 an hour to teach salsa dancing. What is the domain and range of how much money Pablo can make off salsa dancing lessons.  	2
13	Curtis hit 5 home runs in his first game and 3 home runs in each game after that. However, he didn't hit a home run in his 4th game. Find the Domain and Range.  Hint: There is a hole in the game that he didn't hit a homerun.	2
14	If a car is traveling 35 miles per hour, a function can be used to determine how far they have traveled after 1 hour, 2 hours, 3 hours, etc. Explain?	2
15	Three friends X, Y, and Z live in the same society close to each other at a distance of 4 km from each other. If we define a relation R between the distances of each of their houses. Can R be known as an equivalence relation?  	2
16	Define symmetric relation. Give one example	2

17	<p>A Mathematics teacher is going to conduct a test of class-12 students, teacher put the question in front of the students such that</p>  <p>Let <math>A = \mathbf{R} - \{2\}, B = \mathbf{R} - \{1\}</math>. Let <math>f: A \rightarrow B</math> be defined by <math>f(x) = \frac{x-1}{x-2} \forall x \in A</math>. Show that <math>f(x)</math> is One-one function.</p>	2
18	<p>Let R be the relation defined on the natural number N as follow:  <math>R = \{(x,y): x, y \in \mathbf{N} \text{ and } 2x+y=24\}</math>.          Find the domain and range of the relation</p>	2
19	<p>A traffic light is indicated according to the range of the function as given bellow</p> <p><math>f(x) = \frac{ x-1 }{x-1}; x \neq 1</math>. Then find the range of the function</p>  	2
20	<p>Define one-one function. Give one example</p>	2
21	<p>Check whether the relation R defined on the set <math>A = \{1,2,3,4,5,6\}</math> as <math>R = \{(a,b) : b = a+1\}</math> is reflexive.</p>	2
22	<p>Show that the modulus function <math>f: \mathbf{R} \rightarrow \mathbf{R}</math>, given by <math>f(x) =  x </math> is neither one one nor onto.</p>	2
23	<p>State the reason for relation R in the set <math>\{1,2,3\}</math> given by <math>R = \{(1,2), (2,1)\}</math> not to be transitive.</p>	2
24	<p>Let <math>f: \mathbf{R} \rightarrow \mathbf{R}</math> be defined by <math>\begin{cases} 3x, &amp; \text{if } x &gt; 3 \\ x^2, &amp; \text{if } 1 &lt; x \leq 3 \\ x, &amp; \text{if } x \leq 1 \end{cases}</math>, then find <math>f(-2) + f(0) + f(2) + f(5)</math></p>	2
25	<p>Find the range of <math>f(x) = \frac{x-1}{x+1}</math></p>	2
26	<p>Show that the relation R in the set <math>\{1,2,3\}</math> given by <math>R = \{(1,1), (2,2), (3,3), (1,2), (2,3)\}</math> is reflexive but neither symmetric nor transitive.</p>	2
27	<p>Show that the modulus function <math>f: \mathbf{R} \rightarrow \mathbf{R}</math>, given by <math>f(x) =  x </math> is neither one-one nor onto.</p> <p><math>f: \mathbf{R} \rightarrow \mathbf{R}</math>, given by <math>f(x) =  x </math></p>	2
28	<p>Prove that the function f is surjective, where <math>f: \mathbf{N} \rightarrow \mathbf{N}</math> such that <math>f(n) = \begin{cases} \frac{n+1}{2}, &amp; \text{if } n \text{ is odd} \\ \frac{n}{2}, &amp; \text{if } n \text{ is even} \end{cases}</math>.</p> <p>Is the function injective? Justify your answer.</p>	2

29	Show that the function $f: R_+ \rightarrow [4, \infty)$ given by $f(x) = x^2 + 4$ is a bijective function.	2
30	Write the inverse relation corresponding to the relation $R$ given by $R = \{(x, y): x \in N, x < 5, y = 3\}$ . Also write the domain and range of inverse relation.	2

**ANSWER**  
**CHAPTER-01**  
**RELATION AND FUNCTION**

Q.No	ANSWERS	Mark
1	(i) $A_1 \cup A_2 \cup A_3 = A$ (ii) $A_1 \cap A_2 \cap A_3 = \emptyset$	1+1
2	(i) $\{(x, y): x \text{ is a person, } y \text{ is the mother of } x\}$ . It is a function and it is many-one as each person has only one biological mother and two or more person may have same mother. (ii) $\{(a, b): a \text{ is a person, } b \text{ is an ancestor of } a\}$ . It is not a function as a person has more than one ancestor.	2
3	To make reflexive minimum two order pairs i.e. $(b, b)$ and $(c, c)$ must be added. To make transitive $(a, c)$ must be added. So to make reflexive and transitive minimum three ordered pair must be added. Those are $(b, b)$ , $(c, c)$ and $(a, c)$ .	2
4	(a) an injective mapping from A to B. Ex: $f = \{(a, b): b = a + 3, \text{ for all } a \in A \text{ and } b \in B\}$ . Here $f = \{(2, 5), (3, 6), (4, 7)\}$ (b) a mapping from A to B which is not injective. Ex: $f = \{(a, b): b = a^2 - 6a + 5, \text{ for all } a \in A \text{ and } b \in B\}$ . Here $(-3)$ is the image of both 2 and 4.	2
5	Fig-2 is one-one as when a line is drawn parallel to $x$ -axis, it will intersect the curve at only one point. That means for each $x$ there is unique $y$ . But in Fig-1, a line drawn parallel to $x$ -axis will intersect at two points. It means for two values of $x$ , there is one image. Hence not one-one.	2
6	Given, $R = \{(a, cd): a \text{ is a prime number less than } 5\}$ We know that, 2 and 3 are the prime numbers less than 5. So, $a$ can take values 2 and 3. Thus, $R = \{(2, 23), (3, 33)\} = \{(2, 8), (3, 27)\}$ Hence, the range of $R$ is $\{8, 27\}$ .	2
7	Given, $R = \{(a, b): 2 \text{ divides } (a - b)\}$ and $A = \{0, 1, 2, 3, 4, 5\}$ Clearly, $[0] = \{b \in A : (0, b) \in R\}$ $= \{b \in A : 2 \text{ divides } (0 - b)\}$	2

	$= \{b \in A : 2 \text{ divides } (-b)\} = \{0, 2, 4\}$ Hence, equivalence class of $[0] = \{0, 2, 4\}$ .	
8	Given, the relation R is defined on the set of natural numbers, i.e. $\mathbb{N}$ as $R = \{(x, y) : x + 2y = 8\}$ To find the range of R, $x + 2y = 8$ can be rewritten as $y = 8 - x/2$ On putting $x = 2$ , we get $y = 8 - 2/2 = 3$ On putting $x = 4$ , we get $y = 8 - 4/2 = 2$ On putting $x = 6$ , we get $y = 8 - 6/2 = 1$ As, $x, y \in \mathbb{N}$ , therefore $R = \{(2, 3), (4, 2), (6, 1)\}$ . Hence, the range of relation R is $\{3, 2, 1\}$ . Note: For $x = 1, 3, 5, 7, 9, \dots$ we do not get $y$ as natural number.	2
9	Given the function $f: \mathbb{R} \rightarrow \mathbb{R}$ defined as $f(x) = x^2$ .  Now we have $2, -2 \in \mathbb{R}$ but $f(2) = f(-2) = 4$ . This gives that the function $f(x)$ is not one-one.	2
10	$f: \mathbb{R} \Rightarrow \{x \in \mathbb{R} : -1 < x < 1\}$ $f(x) = x/(1 +  x ), x \in \mathbb{R}$ Let's check it for $\pm 1/2 \in (-1, 1)$ $\Rightarrow f(1/2) = (1/2)/(1 + 1/2) = 1/3$ And $f(-1/2) = (-1/2)/(1 - 1/2) = -1$ $f(x)$ is different for each $x \in (-1, 1) \Rightarrow f$ is one - one. And $f(x)$ exists and gives real value for $\forall x \in (-1, 1) \Rightarrow f$ is onto. $\Rightarrow f$ is one-one onto.	2
11	Let us consider, $X = \{\text{set containing 200 elephants in a farm}\}$ $Y = \{\text{set of rabbits}\}$  When we consider the relation R between X and Y such that $R = \{(X, Y) : X \text{ contain elephants}\}$ , we observe that the relation R is void or empty relation since there is only 200 elephants in the farm and no rabbit can be found.	2
12	The number of hours he teaches will go on the x-axis and the amount of money Pablo makes goes on the y axis. The least amount of money he can make is \$0 dollars because he can only make money and he can't go in debt.  The equation is $y = 20x$ because it costs \$20 an hour and $x$ represent the number of hours he teaches.  Hence, The domain is $[0, \infty)$ and the range is also $[0, \infty)$ .	2
13	The number of home runs Curtis hit in a game can be represented by the Function $f(x)$ So, $f(x) = 5$ if $x = 1$ , and $f(x) = 3$ if $x > 1$ .	2

	<p>However, there is a hole at <math>x = 1</math>, where Curtis did hit a home run. So, we need to remove that point from the domain. Therefore, the domain of the function is <math>\{x \mid x &gt; 1\}</math>, and the range is <math>\{3,5\}</math>.</p> <p>Alternatively, we can write the function as:</p> $f(x) = \{5, \text{ if } x = 1, 3, \text{ if } x > 1 \text{ and } x \text{ is an integer, undefined, otherwise}\}$ <p>In this case, the domain is all real numbers except for <math>x = 1</math>, and the range is still <math>\{3, 5\}</math>.</p>	
14	<p>Car is traveling 35 miles per hour. We have to determine how far they travel after 1, 2, 3, etc... hour. According to the question, This function would look like: Miles driven = <math>3x</math>, where <math>x</math> is equal to the number of hours. If this person drove for 1 hours, then the output would be 35 miles. If this person drove for 2 hours, then the output would be 70 miles. If this person drove for 3 hours, then the output would be 105 miles. If this person drove for 1.5 hours, then the output would be 52.5 miles.</p>	2
15	<p>We know that for an equivalence Relation, R must be reflexive, symmetric, and transitive. R is not reflexive as X cannot be at a distance of 4 km away from itself. The relation, R can be said as symmetric as the distance between X and Y is 4 km which is the same as the distance between Y and X. R is said to be transitive as the distance between X and Y is 4 km, the distance between Y and Z is also 4 km and the distance between X and Z is also 4 km. Therefore, this relation is not an equivalence relation.</p>	2
16	<p><b>SYMMETRIC RELATION:</b> - A relation R on a set A is called symmetric relation if <math>aRb</math>. For every <math>a, b \in A \Rightarrow b, a \in A</math> also (1)  Example: <math>A = \{1, 2, 3\}</math>  <math>A \times A = \{(1, 2), (2, 1), (1, 1), (2, 2), (3, 3), (1, 3), (2, 3), (3, 1), (3, 2)\} \in R</math>  Since <math>(a, b) \in R \Rightarrow (b, a) \in R</math> for every <math>a, b \in A</math> (1)</p>	2
17	<p><b>ONE-ONE FUNCTION:</b> -  <math>f(x_1) \neq f(x_2)</math> or <math>\left(\frac{x_1-1}{x_1-2}\right) = \frac{x_2-1}{x_2-2} \Rightarrow x_1 = x_2</math>  <math>\therefore f(x)</math> is one one function (2)</p>	2
18	<p><math>R = \{(1, 22), (2, 20), (3, 18), (4, 16), (5, 14), (6, 12), (7, 10), (8, 8), (9, 6), (10, 4), (11, 2)\}</math>  Domain = <math>\{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11\}</math> (1)  Range = <math>\{2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22\}</math> (1)</p>	2
19	<p>Range of the function  Give that <math>f(x) = \frac{ x-1 }{x-1}; x \neq 1</math> this function can be written as <math>f(x) = \begin{cases} \frac{x-1}{x-1}; \text{ if } x &gt; 1. \\ -\frac{x-1}{x-1}; \text{ if } x &lt; 1. \end{cases}</math>  Or <math>f(x) = \begin{cases} 1; x &gt; 1 \\ -1; x &lt; 1 \end{cases}</math> Hence the range of <math>f(x)</math> is <math>\{1, -1\}</math> (2)</p>	2

20	<p><b>ONE-ONE FUNCTION:-</b> A function <math>f: A \rightarrow B</math> is said to be one one if <math>a \neq b \Rightarrow f(a) \neq f(b)</math> for all <math>a, b \in A</math>  or <math>f(a) = f(b) \Rightarrow a = b</math> for all <math>a, b \in A</math> (1)  Example:- Let <math>f: R \rightarrow R</math> be a function such that <math>f(a) = x+1</math> is one-one function (1)</p>	2
21	<p>Let <math>a \in A</math>  <math>a \neq a+1 \rightarrow (a, a)</math> does not belongs to <math>A</math>  so <math>R</math> is not reflexive.</p>	2
22	<p><b>ONE-ONE :</b> Let <math>x_1 = 1, x_2 = -1</math> be the two elements belongs to <math>R</math>  <math>F(x_1) = f(x_2) = 1</math>  <math>F</math> is many one.  <b>ONTO:</b> let <math>f(x) = -1,  x  = -1 \in R</math> which is not possible. So not ONTO</p>	2
23	<p><math>R</math> is not transitive as <math>(1, 2) \in R, (2, 1) \in R</math> but <math>(1, 1)</math> does not belongs to <math>R</math></p>	2
24	<p><math>f(-2) + f(0) + f(2) + f(5) = -2 + 0 + 2^2 + 3 * 5 = -2 + 4 + 15 = 17</math></p>	2
25	<p>Given <math>R = \{(1, 1), (2, 2), (3, 3), (1, 2), (2, 3)\}</math> defined on  <math>R: \{1, 2, 3\} \rightarrow \{1, 2, 3\}</math>  <b>For reflexive:</b> As <math>(1, 1), (2, 2), (3, 3) \in R</math>. Hence, reflexive  <b>For symmetric:</b> <math>(1, 2) \in R</math> but <math>(2, 1) \notin R</math>. Hence, not symmetric.  <b>For transitive:</b> <math>(1, 2) \in R</math> and <math>(2, 3) \in R</math> but <math>(1, 3) \notin R</math>.  Hence, not transitive.</p>	$\frac{1}{2}$ $\frac{1}{2}$ 1
26	<p>Given <math>f: R \rightarrow R</math>, given by <math>f(x) =  x </math>  Take <math>x = 2</math> and <math>x = -2</math>  then <math>f(2) = 2</math> and <math>f(-2) = 2</math> that is image of two distinct elements is same. Therefore <math>f</math> is not one-one.  Also negative real numbers in co-domain have no pre-image in the domain. Therefore <math>f</math> is not onto.</p>	1 1
27	<p><b>Surjectivity:</b> Let <math>n</math> be an arbitrary element of <math>N</math>.  If <math>n</math> is an odd natural number, then <math>2n - 1</math> is also an odd natural number such that  <math>f(2n - 1) = \frac{2n-1+1}{2} = n</math>.  If <math>n</math> is an even natural number, then <math>2n</math> is also an even natural number such that <math>f(2n) = \frac{2n}{2} = n</math>.  Thus for every <math>n \in N</math> (whether even or odd) there exists its pre-image in <math>N</math>. So <math>f</math> is surjective.  <b>Injectivity:</b> <math>1, 2 \in N(\text{domain})</math> such that <math>f(1) = 1 = f(2)</math>.  Hence <math>f</math> is not injective.</p>	1 1
28	<p><b>One-One:</b> Let <math>x_1, x_2 \in R_+</math> (Domain)  <math>f(x_1) = f(x_2) \Rightarrow x_1^2 + 4 = x_2^2 + 4</math></p>	1

	$\Rightarrow x_1^2 = x_2^2$ $\Rightarrow x_1 = x_2 \quad [x_1 \text{ \& } x_2 \text{ are positive real numbers}].$ <p>Hence <math>f</math> is one-one function.</p> <p><b>Onto:</b> Let <math>y \in [4, \infty)</math> such that <math>y = f(x) \quad \forall x \in R_+</math></p> $\Rightarrow y = x^2 + 4$ $\Rightarrow x = \sqrt{y - 4} \quad [x \text{ is a positive real number}]$ <p>Obviously, <math>\forall y \in [4, \infty)</math>, <math>x</math> is a real number <math>\in R_+</math> (<i>Domain</i>)  <i>i.e.</i> all elements of codomain have pre-image in domain.  <math>\Rightarrow f</math> is onto.</p> <p>Hence <math>f</math> is a bijective function.</p>	1
29	<p>Given, <math>R = \{(x, y): x \in N, x &lt; 5, y = 3\}</math></p> $\Rightarrow R = \{(1, 3), (2, 3), (3, 3), (4, 3)\}.$ <p>Hence required inverse relation is</p> $R^{-1} = \{(3, 1), (3, 2), (3, 3), (3, 4)\}.$ <p>Domain of <math>R^{-1} = \{3\}</math>.</p> <p>Range of <math>R^{-1} = \{1, 2, 3, 4\}</math>.</p>	$\frac{1}{2}$ $\frac{1}{2}$
