

CHAPTER-12
INTRODUCTION TO 3D
03 MARK TYPE QUESTIONS

Q. NO	QUESTION	MARK
1.	Find the equation of the set of points P, the sum of whose distances from A (4, 0, 0) and B (-4, 0, 0) is equal to 10.	3
2.	<p>A man visited India gate and moving on path, he observed that his distance from India gate is always 500 metres. Taking india gate as origin. Answer the following:</p> <p>(i) Find the equation of path of the man.</p> <p>(ii) If he saw a balloon seller is at point (600,800) then the man has to move towards India gate or away from it.</p> <p>(iii) If man is considered to be at point (400,300), then find the distance between balloon seller and man.</p>	3
3.	<div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;">  </div> <div style="text-align: center;">  </div> </div> <p>A building is to be constructed in the form of a triangular pyramid as shown in the figure. Let its angular points are A(0,1,2), B(3,0,1), C(4,3,6) and D(2,3,2) and G be the point of intersection of the median of ΔBCD.</p> <p>(i) Find the coordinates of point G.</p> <p>(ii) Find the length of AG.</p>	3
4.	<p>Two Racing cars started their linear journey from a fixed point. Find the condition for which the lines $x \cos A + y \sin A = p_1$ and $x \cos B + y \sin B = p_2$ will be perpendicular to each other.</p> <div style="text-align: center;">  </div>	3
5.	<p>A Marriage programme is arranged on a triangular plot costing Rs.5,000 per sq.m. Show that the area of triangle with vertices at $(p - 4, p + 5)$, $(p + 3, p - 2)$ and (p, p) is independent of p. Also find the arrangement cost .</p>	3

		
6.	Mahendra went on a linear drive which passes through the point of intersection of roads $3x + 4y - 1 = 0$ and $2x - 5y + 7 = 0$ and which is perpendicular to a crossroad $4x - 2y + 7 = 0$. Find the equation of the straight line.	3
		
7.	Find the point P on Z – axis such that $PA = PB$ where A (1,5,7) B (5,1,-4)	3
8.	If the extremities (end points) of a diagonal of a square are (1,-2,3) and (2,-3,5) then find the length of the side of square	3
9.	If the distance between the points (a,0,2) and (1,1,0) is $\sqrt{14}$ units, then find the value of a.	3
10.	Show that the points A(1,2,1), B(1,-2,2),C(5,-2,1) and (5,2,2) are the vertices of a square.	3
11.	Three consecutive vertices of a parallelogram PQRS are P (1,1,2), Q(1,2,-4) and R(3,-1,2). Find the coordinates of the fourth vertex.	3
12.	Verify that the points A(3,-2,4), B(1,0,-2) and C(-1,2,-8) are collinear.	3
13.	Find the ratio in which the line segment joining A(2,4,5) and B(3,5,4) divided by the <i>yz plane</i> .	3
14.	The straight line joining the points (3,4,3) and (2,1,5) intersects the plane $2x + 2y - 2z = 1$ at P; find the coordinates of P.	3
15.	The mid points of the sides of a triangle are (1,5, -1), (0,4, -2) and (2,3,4). Find its vertices. Also find the centroid of the triangle.	3
16.	Find the points in (i) ZX-plane (ii) YZ-plane and (iii) XY-plane which are equidistant from the points P (3,2, -1), Q (2,1,2) and R (1, -1,0).	3
		
17.	Find the coordinates of the points which trisect the line segment joining the points P (4,2, -6) and Q (10, -16,6).	3
	$ \begin{array}{ccccccc} P & \text{-----} & & & & & Q \\ (4,2, -6) & & A & & B & & (10,-16,6) \end{array} $	
18.	Find the ratio in which YZ-plane divides the line segment joining points (-2,4,7) and (3, -5,8). Also, find the coordinates of the point of intersection.	3

19.	<p>Find the co-ordinates of the points which trisects the line segment PQ formed by joining the point $P(4, 2, -6)$ and $Q(10, -16, 6)$</p>	3
20.	<p>If the points $P(1, 0, -6)$, $Q(-3, P, q)$ and $R(-5, 9, 6)$ are collinear, find the values of P and q</p>	3
21.	<p>Show that coordinator of the centroid of triangle with vertices $A(x_1, y_1, z_1)$, $B(x_2, y_2, z_2)$, and $C(x_3, y_3, z_3)$ is</p> $\left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3}, \frac{z_1 + z_2 + z_3}{3} \right)$	3

ANSWERS:

Q. NO	ANSWER	MARKS
1.	<p>Let the coordinates of P be (x, y, z).</p> <p>The coordinates of points A and B are $(4, 0, 0)$ and $(-4, 0, 0)$ respectively.</p> <p>It is given that $PA + PB = 10$.</p> $\Rightarrow \sqrt{(x-4)^2 + y^2 + z^2} + \sqrt{(x+4)^2 + y^2 + z^2} = 10$ $\Rightarrow \sqrt{(x-4)^2 + y^2 + z^2} = 10 - \sqrt{(x+4)^2 + y^2 + z^2}$ <p>On squaring both sides, we obtain</p> $\Rightarrow (x-4)^2 + y^2 + z^2 = 100 - 20\sqrt{(x+4)^2 + y^2 + z^2} + (x+4)^2 + y^2 + z^2$ $\Rightarrow x^2 - 8x + 16 + y^2 + z^2 = 100 - 20\sqrt{x^2 + 8x + 16 + y^2 + z^2} + x^2 + 8x + 16 + y^2 + z^2$ $\Rightarrow 20\sqrt{x^2 + 8x + 16 + y^2 + z^2} = 100 + 16x$ $\Rightarrow 5\sqrt{x^2 + 8x + 16 + y^2 + z^2} = (25 + 4x)$ <p>On squaring both sides again, we obtain</p> $25(x^2 + 8x + 16 + y^2 + z^2) = 625 + 16x^2 + 200x$ $\Rightarrow 25x^2 + 200x + 400 + 25y^2 + 25z^2 = 625 + 16x^2 + 200x$ $\Rightarrow 9x^2 + 25y^2 + 25z^2 - 225 = 0$ <p>Thus, the required equation is $9x^2 + 25y^2 + 25z^2 - 225 = 0$.</p>	3
2.	<p>(i) Equation of path as locus of man will be circle as his distance from India gate is constant which is equal to 500m. Now, taking India gate as center $(0,0)$ Radius 500m Equation of circle is $x^2 + y^2 = 250000$.</p> <p>(ii) Distance of balloon seller from India gate $= \sqrt{(600 - 0)^2 + (800 - 0)^2}$ $= \sqrt{360000 + 640000} = 1000$ m Since, balloon seller is standing at its distance 1000m which is more than 500m. so, man has to move away from India gate.</p> <p>(iii) Distance between man $(400,300)$ and balloon seller $= \sqrt{(600 - 400)^2 + (800 - 300)^2}$ $= \sqrt{40000 + 250000} = 100\sqrt{29}$ m.</p>	3

3.	<p>(i) Clearly, G be the centroid of ΔBCD $= \left(\frac{3+4+2}{3}, \frac{0+3+3}{3}, \frac{1+6+2}{3} \right) = (3,2,3)$</p> <p>(ii) $AG = \sqrt{(3-0)^2 + (2-1)^2 + (3-2)^2}$ $= \sqrt{3^2 + 1^2 + 1^2} = \sqrt{9+1+1} = \sqrt{11}$</p>	3
4.	<p>$M_1 = -\cot A$, $m_2 = -\cot B$, lines perpendicular $\Rightarrow m_1 m_2 = -1$, $\cot A \cdot \cot B = -1 \cos A \cdot \cos B + \sin A \cdot \sin B = 0$, $\cos(A-B) = 0 \Rightarrow A-B = 90^\circ$</p>	1 +1 +1
5.	<p>Area of triangle $= \frac{1}{2} [(p-4)(-2) + (p+3)(-5) + p(7)]$ $= \frac{1}{2} -7 = \frac{7}{2}$ is independent of p. Cost of programme Rs. $5000 \times \frac{7}{2} = \text{Rs. } 17,500$</p>	1 +1 +1
6.	<p>Eq. of line through intersection of lines $3x+4y-1=0$ & $2x-5y+7=0$ is $(3x+4y-1) + k(2x-5y+7) = 0$ --- (eq) It is perpendicular to line $4x-2y+7=0$ $m_1 \cdot m_2 = -1 \Rightarrow \left\{ \frac{-3+2k}{4-5k} \right\} \cdot 2 = -1$ $k = -\frac{2}{9}$. substituting in (eq.) we have $(3x+4y-1) + (-\frac{2}{9})(2x-5y+7) = 0$ $\Rightarrow x+2y-1=0$</p>	1 +1 +1
7.	<p>Given that $A = (1, 5, 7)$ and $B = (5, 1, -4)$ Consider the point be P having co ordinates as it is on z – axis $PA = PB$ on, $(PA)^2 = (PB)^2$ $\Rightarrow (1-0)^2 + (5-0)^2 + (7-a)^2 = (5-0)^2 + (1-0)^2 + (-4-a)^2$ $\Rightarrow 1+25+49+a^2-14a = 25+1+16+a^2+8a$ $\Rightarrow 14a + 8a = 49 - 16$ $\Rightarrow 22a = 33$ $\Rightarrow a = \frac{3}{2}$ Therefore, point 'p' is $(0, 0, \frac{3}{2})$</p>	3
8.	<p>The points are $B(1, -2, 3)$ and $D(2, -3, 5)$ $BD = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2}$ $= \sqrt{(2-1)^2 + (-3+2)^2 + (5-3)^2}$ $= \sqrt{1+1+4}$ $= \sqrt{6}$ We know that the length of diagonal is equal to $\sqrt{2}$ times of side length $\therefore \sqrt{6} = \sqrt{2} \times \text{side length of square}$ Length of side of square $= \sqrt{\frac{6}{2}}$ $= \sqrt{3}$</p>	3
9.	<p>Let the given points be $A(a, 0, 2)$ and $B(1, 1, 0)$ Given that the distance between A and B is 5. $AB = 5$ $\Rightarrow \sqrt{(1-a)^2 + (1-0)^2 + (0-2)^2} = \sqrt{14}$ $\Rightarrow (1-a)^2 + 1 + 4 = 14$</p>	3

	$\Rightarrow 1+a^2-2a+5 = 14$ $\Rightarrow a^2 -2a - 8 = 0$ $\Rightarrow (a + 4) (a - 2) = 0$ $\Rightarrow a = -4, 2$	
10.	$AB=BC=CD=DA=\sqrt{17}$ Diagonal AC= Diagonal BD= $4\sqrt{2}$ Hence, ABCD is a square.	3
11.	We Know that the diagonals of a parallelogram bisect each other. Mid point of PR=Mid-point QS hence Find the coordinates of the fourth vertex S is (1,-2,8)	3
12.	Using Distance formula $AB=2\sqrt{11}$; $BC=2\sqrt{11}$; $CA=4\sqrt{11}$ We observe that $AB+BC=CA$ Hence, A,B and C are collinear.	3
13.	Since the line segment joining $A(2,4,5)$ and $B(3,5,4)$ is divided by the Y-Z plane C, so $x = 0$. Let the ratio be m: n Coordinate of the point C = $(\frac{mx_2+nx_1}{m+n}, \frac{my_2+ny_1}{m+n}, \frac{mz_2+nz_1}{m+n})$ $\frac{mx_2 + nx_1}{m + n} = 0$ $\frac{m3 + n2}{m + n} = 0$ $3m + 2n = 0$ $\frac{m}{n} = -\frac{2}{3}$ $m:n = 2:3$ (divides externally)	3
14.	Let us suppose the point P divides the line segment joining the points $A(3,4,3)$ and $B(2,1,5)$ in the ratio m: n Then the coordinate of P is $(\frac{2m+3n}{m+n}, \frac{m+4n}{m+n}, \frac{5m+3n}{m+n})$ Since $2x + 2y = 2z = 1$ $2\frac{2m+3n}{m+n} + 2\frac{m+4n}{m+n} - 2\frac{5m+3n}{m+n} = 1$ $\frac{2m+3n+m+4n-5m-3n}{m+n} = \frac{1}{2} \frac{m}{n} = \frac{7}{5}$ $m:n = 7:5$	3
15.	Let $A(x_1, y_1, z_1), B(x_2, y_2, z_2), C(x_3, y_3, z_3)$ be the vertices of the triangle and let $D(1,5, -1), E(0,4, -2)$ and $F(2,3,4)$ be mid points of the sides BC,CA and AB respectively. Then, $\frac{x_2+x_3}{2} = 1, \frac{y_2+y_3}{2} = 5, \frac{z_2+z_3}{2} = -1; \frac{x_3+x_1}{2} = 0, \frac{y_3+y_1}{2} = 4, \frac{z_3+z_1}{2} = -2; \frac{x_1+x_2}{2} = 2, \frac{y_1+y_2}{2} = 3, \frac{z_1+z_2}{2} = 4.$ Thus, $x_2 + x_3 = 2, x_3 + x_1 = 0, x_1 + x_2 = 4;$ $y_2 + y_3 = 10, y_3 + y_1 = 8, y_1 + y_2 = 6;$	3

	$z_2 + z_3 = -2, z_3 + z_1 = -4, z_1 + z_2 = 8.$ Adding first three equations, we get $2(x_1 + x_2 + x_3) = 6$ or $x_1 + x_2 + x_3 = 3$ Thus $x_1 = 1, x_2 = 3, x_3 = -1.$ Adding next three equations, we get $y_1 = 2, y_2 = 4, y_3 = 6.$ Adding last three equations, we get $z_1 = 3, z_2 = 5, z_3 = -7.$ Hence the vertices of the given triangle are $A(1,2,3), B(3,4,5)$ and $C(-1,6,-7)$	
16.	(i) $(\frac{31}{10}, 0, \frac{1}{5})$ (ii) $(0, \frac{31}{16}, \frac{-3}{16})$ (iii) $(\frac{3}{2}, 1, 0)$	
17.	$(6, -4, -2)$ and $(8, -10, 2)$	
18.	$2:3$ and $(0, \frac{2}{5}, \frac{37}{5})$	
19.	<p>Let R and S be the points of trisection of the segment PQ. Then</p>  <p>$\therefore PR = RS = SQ$ $\Rightarrow 2PR = RQ$ $\Rightarrow \frac{PQ}{RQ} = \frac{1}{2}$</p> <p>R divides PQ in the ratio 1:2 Co-ordinates of point R</p> $R \left[\frac{1(10) + 2(-4)}{1+2}, \frac{1(-16) + 2(2)}{1+2}, \frac{1(6) + 2(-6)}{1+2} \right]$ <p>$R(6, -4, -2)$</p> <p>$PS = 2SQ$</p> $\Rightarrow \frac{PS}{SQ} = \frac{2}{1}$ <p>S divides PQ in the ratio 2:1 co-ordinates of point S</p> $\left[\frac{2(10) + 1(-4)}{1+2}, \frac{2(-16) + 1(2)}{1+2}, \frac{2(6) + 1(-6)}{1+2} \right]$ <p>$\therefore S(8, -10, 2)$</p>	3
20.	<p>Given points P $(1, 0, -6)$ Q $(-3, P, q)$ and R $(-5, 9, 6)$ are collinear . Let point Q divides PR in the ratio k:1 Therefore co-ordinates of point P $(\frac{1-5K}{K+1}, \frac{0+9K}{K+1}, \frac{-6+6K}{K+1})$ and Q $(-3, P, q) \frac{1-5K}{K+1} = -3$ $1-5k = -3k-3$</p>	3

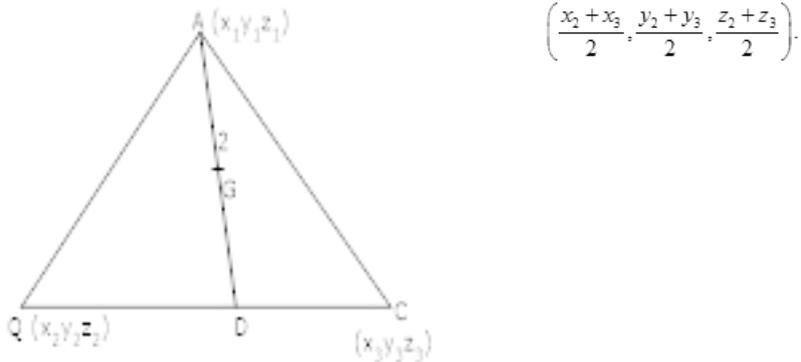

$$-2k=-4$$

$$K=2$$

Therefore the value of P and q are 6 and -2 .

21. Let D be the mid point of AC. Then co ordinates of D are

3

Let G be the centroid of $\triangle ABC$. Then G, divides AD in the ratio 2:1. So coordinates of D are

$$\left(\frac{1 \cdot x_1 + 2 \left(\frac{x_2 + x_3}{2} \right)}{1+2}, \frac{1 \cdot y_1 + 2 \left(\frac{y_2 + y_3}{2} \right)}{1+2}, \frac{1 \cdot z_1 + 2 \left(\frac{z_2 + z_3}{2} \right)}{1+2} \right)$$

$$\left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3}, \frac{z_1 + z_2 + z_3}{3} \right)$$
