	SECTION - A	
	(Multiple Choice Questions)	
1.	(b) 315	1
2.	(d) 2	1
3.	(b) $(x-3)(x+2)=x(4x+5)$	1
4.	(d) $\sqrt{2}$	1
5.	(a) $a = -1, b = 15$	1
6.	(c) equilateral	1
7.	(b) 18 m	1
8.	(a) 4	1
9.	(c) 1	1
10.	(d) $115^0$	1
11.	(c) 24 cm	1
12.	(d) 12 cm	1
13.	(a) $0^0$	1
14.	(a) $\frac{11}{26}$	1
15.	(d) $\frac{\theta}{720} \times 2\pi R^2$	1
16.	(c) 30	1
17.	(a) 20	1
18.	(b) 0.38	1
19.	(c) Assertion is true, Reason is false.	1
20.	(d) Assertion is false, Reason is true.	1
SECTION B		
21.	(a) $5 \times 7 \times 11 \times 13 + 7 \times 11$ $= 7 \times 11 (5 \times 13 + 1)$ $= 7 \times 11 \times 11 \times 2 \times 3$	1 1

	<p>Factorisation of number contains more than one prime. So by fundamental theorem of arithmetic, this is a composite number.</p> <p><b>OR</b></p> <p>(b) <math>(12)^n = (2 \times 2 \times 3)^n = 2^{2n} \times 3^n</math>  Primes in factorisation of <math>(12)^n</math> are 2 and 3. To end in digit 0 prime factorization of <math>(12)^n</math> should also contain the prime 5. Therefore, there is no natural number n for which <math>(12)^n</math> ends with digit zero.</p>	1 1
22.	<p>To find the <b>zeros</b>, <math>p(x) = 0</math>:  <math>x^2 + 7x + 12 = 0</math>  <math>(x+3)(x+4) = 0</math>  <math>x = -3, x = -4</math></p> <p><b>To verify the relationship between zeros and coefficients</b>  <math>a = 1, b = 7, c = 12</math></p> <p><b>Sum of zeros :</b>  <math>(-3) + (-4) = -7</math>  <math>-\frac{b}{a} = -\frac{7}{1} = -7</math></p> <p><b>Product of zeros :</b>  <math>(-3) \times (-4) = 12</math>  <math>\frac{c}{a} = \frac{12}{1} = 12</math></p>	1           1/2   1/2
23.	<p><math>k \cdot x \cdot (x-3) + 9 = 0</math> or <math>kx^2 - 3kx + 9 = 0</math>  For equal roots, <math>b^2 - 4ac = 0</math>  <math>9k^2 - 36k = 0</math> or <math>k = 0</math> (rejected), <math>k = 4</math></p>	1/2 1/2 1
24.	<p>Given: Vertices <math>A(3, 2)</math>, <math>B(1, 0)</math>, and midpoint of diagonals <math>O(2, -5)</math>.  Let the other two vertices be <math>C(x_1, y_1)</math> and <math>D(x_2, y_2)</math>.</p> <p>Mid point of AC is O</p> $\frac{3+x_1}{2} = 2, \frac{2+y_1}{2} = -5$ $x_1 = 1, y_1 = -12$ <p>Mid point of BD is O</p> $\frac{1+x_2}{2} = 2, \frac{0+y_2}{2} = -5$ $x_2 = 3, y_2 = -10$ <p>So C is (1, -12), D is (3, -10)</p>	1           1
25.	<p>(a) <math>\sin(A+B) = 1</math> or <math>\sin(A+B) = \sin 90^\circ</math>  <math>A+B = 90^\circ</math> -----(1)</p> <p><math>\cos(A-B) = \frac{\sqrt{3}}{2}</math> or <math>\cos(A-B) = \cos 30^\circ</math>  <math>A-B = 30^\circ</math> -----(2)</p> <p>On solving equation 1 and 2 we get <math>A = 60^\circ</math>, <math>B = 30^\circ</math></p> <p><b>OR</b></p> <p>(b) <math display="block">\frac{2\cos^2 90^\circ + 4\cos^2 45^\circ + \tan^2 60^\circ + 3\operatorname{cosec}^2 60^\circ + 1}{3\sec 60^\circ - 7/2 \sec^2 45^\circ + 2\operatorname{cosec} 30^\circ - 1}</math></p> $= \frac{2 \times 0 + 4 \times \frac{1}{2} + 3 + 3 \times \frac{4}{3} + 1}{3 \times 2 - 7/2 \times 2 + 2 \times 2 - 1} = 10/2 = 5$	1/2  1/2  1           1 1

### SECTION C

<p><b>26.</b></p>	<p>Let's assume <math>\sqrt{3}</math> is a rational number  <math>\Rightarrow \sqrt{3} = p/q</math> where p and q are coprime integers and <math>q \neq 0</math>.  <math>\Rightarrow \sqrt{3} q = p</math>..... (1).  Take squares on both sides of equation (1).  <math>\Rightarrow 3q^2 = p^2</math>  <math>\therefore 3</math> is a prime number that divides <math>p^2</math>, so 3 divides p.  <math>\Rightarrow 3</math> is a factor of p.  Therefore, p is a number that divides q.  Let <math>p = 3a</math> where a is a whole number.  Substitute the value of p in equation (1)  <math>\Rightarrow 3q^2 = (3a)^2</math>  <math>\Rightarrow 3q^2 = 9a^2</math>  <math>\Rightarrow q^2 = 3a^2</math>  <math>\Rightarrow q^2 / 3 = a^2</math> ..... (2)  3 is a prime number that divides <math>q^2</math>, so 3 divides q  <math>\Rightarrow</math> Since 3 is a factor of q.  From equation 1 and 2, we can conclude that  3 is a factor of p, 3 is a factor of q.  So 3 is a factor of both p and q.  This leads to the contradiction to our assumption that p and q are co-primes  .</p>	<p><math>\frac{1}{2}</math></p> <p><math>\frac{1}{2}</math></p> <p><math>\frac{1}{2}</math></p> <p><math>\frac{1}{2}</math></p> <p><math>\frac{1}{2}</math></p>
<p><b>27.</b></p>	<p>The first 16 multiples of 7 are: 7, 14, 21, 28, 35, 42, 49, 56, 63, 70, 77, 84, 91, 98, 105, 112  This forms an <b>Arithmetic Progression (AP)</b> where:  First term (a) = 7  Common difference (d) = 7  Number of terms (n) = 16  <math>S_n = n/2 \times [2a + (n - 1)d]</math>  <math>= 16/2 \times [2(7) + (16 - 1)(7)]</math>  <math>= 8 \times [14 + 15(7)]</math>  <math>= 8 \times [14 + 105]</math>  <math>= 8 \times 119</math>  <math>= \mathbf{952}</math></p>	<p><math>\frac{1}{2}</math></p> <p>1</p> <p><math>\frac{1}{2}</math></p> <p>1</p>
<p><b>28.</b></p>	<p>(a) Let x be the price of one pencil and y be the price of one pen.  Alok's purchase: <math>2x + 3y = 40</math>  Rahul's purchase: <math>x + 2y = 25</math>  Solution is (5, 10)  The price of one pencil is Rs.5  and of one pen is Rs. 10</p> <p style="text-align: center;"><b>OR</b></p> <p>(b) Let us assume that Rohan's present age = X years and Grandfather's present age = Y years  ATQ, <math>X + Y = 88</math> ... (equation 1)  <math>Y - 12 = 7(X - 12)</math>  <math>7X - Y = 72</math> ... (equation 2)  Solving the equations:  X = 20 years  Y = 68 years  <b>Answer: Rohan is 20 years old and his grandfather is 68 years old.</b></p>	 <p><math>\frac{1}{2}</math></p> <p><math>\frac{1}{2}</math></p> <p>1</p> <p>1</p> <p>1</p>

29.	<p>In the given figure, P, Q, R, S are points of contact AS = AP (The tangents drawn from an external point to a circle are equal.) <math>\angle SOA = \angle POA = \angle 1 = \angle 2</math> (Tangents drawn from a point outside of the circle, subtend equal angles at the centre) Similarly, <math>\angle 3 = \angle 4, \angle 5 = \angle 6, \angle 7 = \angle 8</math> Since complete angle is <math>360^\circ</math> at the centre, We have, <math>\angle 1 + \angle 2 + \angle 3 + \angle 4 + \angle 5 + \angle 6 + \angle 7 + \angle 8 = 360^\circ</math> <math>2 (\angle 1 + \angle 8 + \angle 4 + \angle 5) = 360^\circ</math> (or) <math>2 (\angle 2 + \angle 3 + \angle 6 + \angle 7) = 360^\circ</math> <math>\angle 1 + \angle 8 + \angle 4 + \angle 5 = 180^\circ</math> (or) <math>\angle 2 + \angle 3 + \angle 6 + \angle 7 = 180^\circ</math> From above figure, <math>\angle 1 + \angle 8 = \angle AOD, \angle 4 + \angle 5 = \angle BOC</math> and <math>\angle 2 + \angle 3 = \angle AOB, \angle 6 + \angle 7 = \angle COD</math> Thus we have, <math>\angle AOD + \angle BOC = 180^\circ</math> (or) <math>\angle AOB + \angle COD = 180^\circ</math> <math>\angle AOD</math> and <math>\angle BOC</math> are angles subtended by opposite sides of <u>quadrilateral</u> circumscribing a circle and the sum of the two is <math>180^\circ</math>. Hence proved.</p>		1  <
